01 · START HERE

Open the system and sign in

Project IAN (Inventory and Asset Navigator) is the school's local inventory application. This manual starts with first-time setup and login, then walks through settings, daily inventory work, reports, and safe shutdown.

SCREENSHOT 1 · PROJECT IAN LOGIN

This is a direct screen capture of the login page. The username and password fields are intentionally blank.

1 Start the installed app

Open **Inventory System** from the desktop shortcut or Windows Start Menu. The launcher starts the local web and database services and opens the app window. For the packaged installer, the first launch displays administrator setup before login.

2 Create the first administrator

On the first-run setup page, enter an administrator name, username, and password twice. The username must be 3–50 characters using letters, numbers, dots, underscores, or hyphens. Choose a private password of at least 12 characters; keep it somewhere secure.

3 Log in

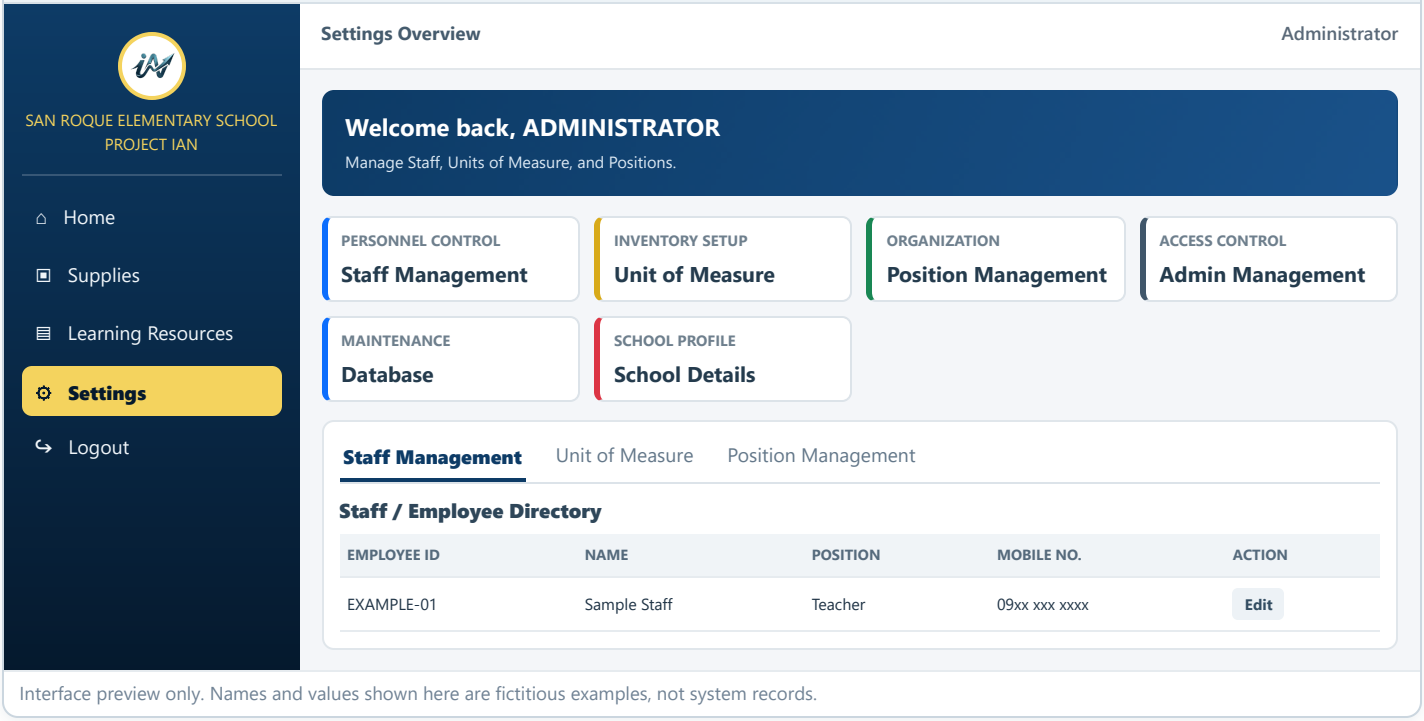

1. Type the administrator username into **Username**.
2. Type the matching password into **Password**.

02 · RECOMMENDED FIRST VISIT

1 Set up Settings

Select **Settings** in the left menu. Set up the school profile and reference lists before adding inventory; these lists are used in item forms, recipients, and reports.

SCREEN PREVIEW · SETTINGS OVERVIEW (SAMPLE DATA)

Interface preview only. Names and values shown here are fictitious examples, not system records.

Suggested setup order

1. **Positions:** add the school's official position names first.
2. **Staff Management:** add each employee ID, full name, position, and mobile number. Staff entries are used as recipients.
3. **Unit of Measure:** add the standard units staff should select for supplies.
4. **School Details:** enter the school name/address and choose the school head and custodian. These selections depend on your staff and position lists.

Account and data controls

- **Admin Management** updates the administrator name/username. Enter the current password; provide and confirm a new password only when changing it.
- **Database** offers a backup download, SQL import, and record deletion.
- Use **Edit** for corrections. Delete only after checking that the record is no longer needed.

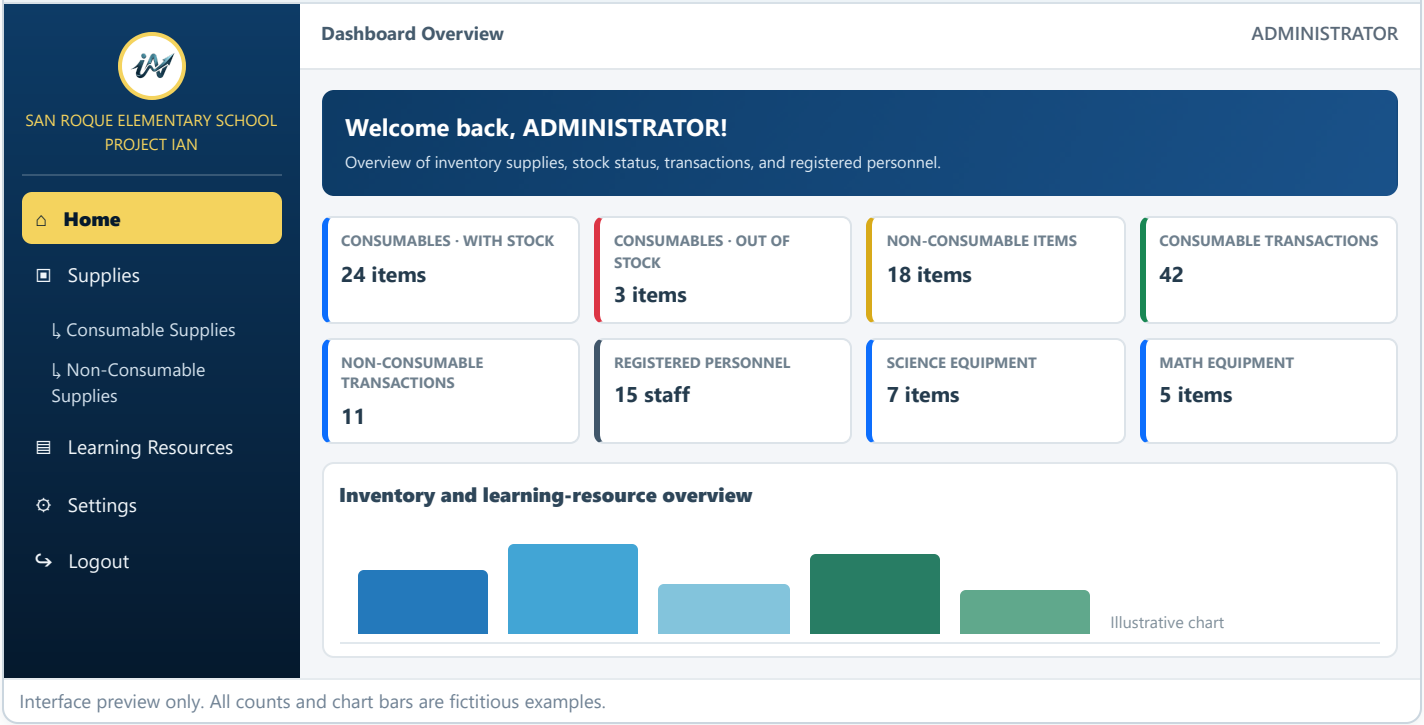

Careful: Import replaces database contents. Delete Records permanently removes operational records while retaining selected setup/account tables. Make a backup first and use these actions only when authorized.

03 · HOME DASHBOARD

2 Read the overview

Select **Home** in the sidebar after logging in. Dashboard tiles summarize current records; charts and tables help you review learning-resource distribution and transaction activity.

SCREEN PREVIEW · HOME DASHBOARD (SAMPLE VALUES)

Interface preview only. All counts and chart bars are fictitious examples.

What the tiles mean

- Consumable items are counted separately when quantity is above zero or zero/below.
- Other tiles summarize non-consumables, recorded transactions, registered employees, and Science/Math equipment.
- Dashboard totals are a quick overview—not a substitute for checking the item table or official report.

Use the left menu

Home — totals and charts

Supplies — two inventory types

Learning Resources — equipment and books

Settings — staff and school setup

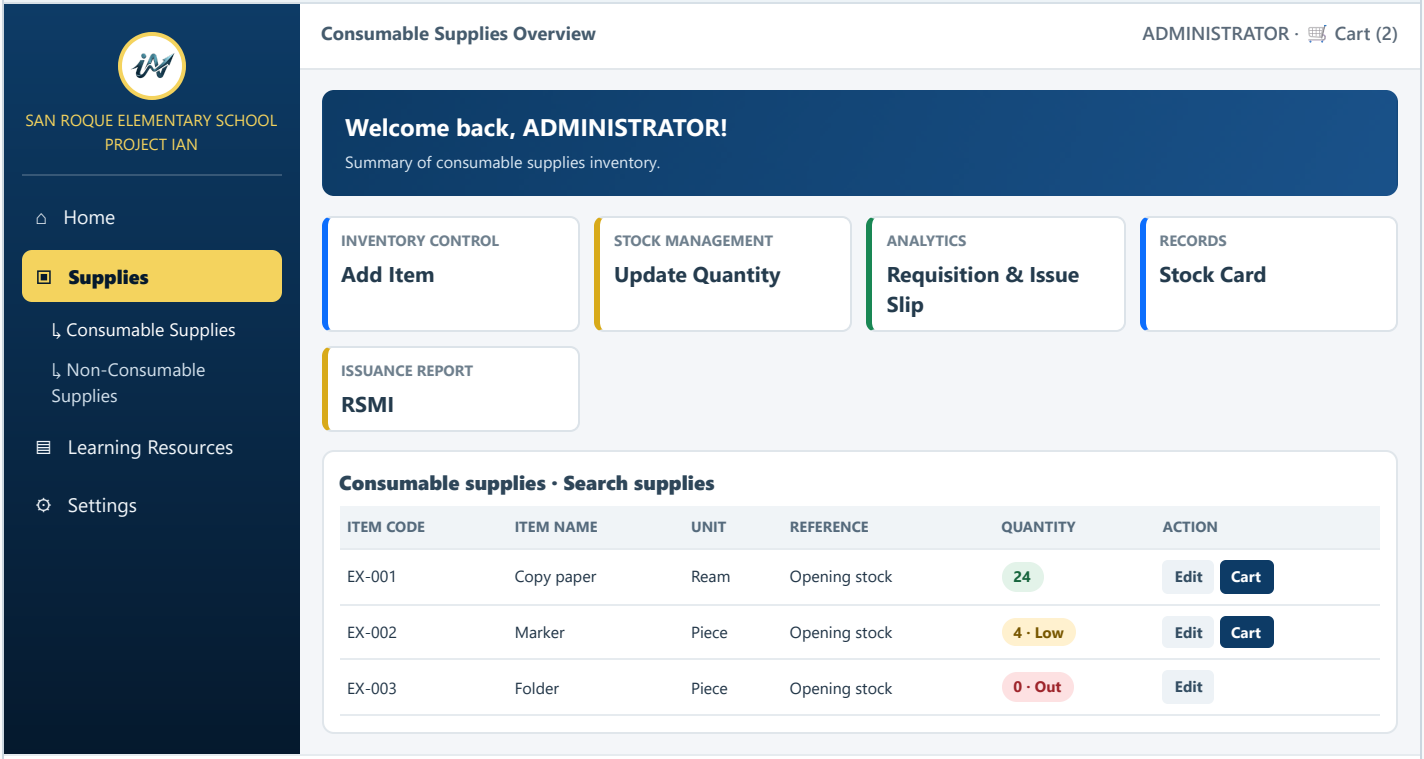

Select a menu heading to expand its sub-pages. The name and role at the upper-right identify the signed-in account.

04 · SUPPLIES

3 Consumable supplies

Open **Supplies** → **Consumable Supplies**. This section tracks stock items that are used up, such as paper and classroom materials.

SCREEN PREVIEW · CONSUMABLE SUPPLIES TABLE (SAMPLE DATA)

Interface preview only. Item names, codes, stock levels, and cart count are examples.

Add a supply or record incoming stock

1. Select **Add Item**. Enter item code, item name, unit, quantity, and a useful reference; save.
2. To increase an existing stock balance, select **Update Quantity**, find the item, and enter the new total quantity and its reference.
3. Search the table to confirm the correct item and balance are shown.

Release supplies to staff

1. Use the row's cart button to add an item and quantity; repeat for other items.
2. Open the cart icon. Review the cart and select the intended recipient(s). Each selected recipient receives every item in that cart.
3. Select **Release Items** only after verifying quantities and recipients. Check the transaction/report record afterward.

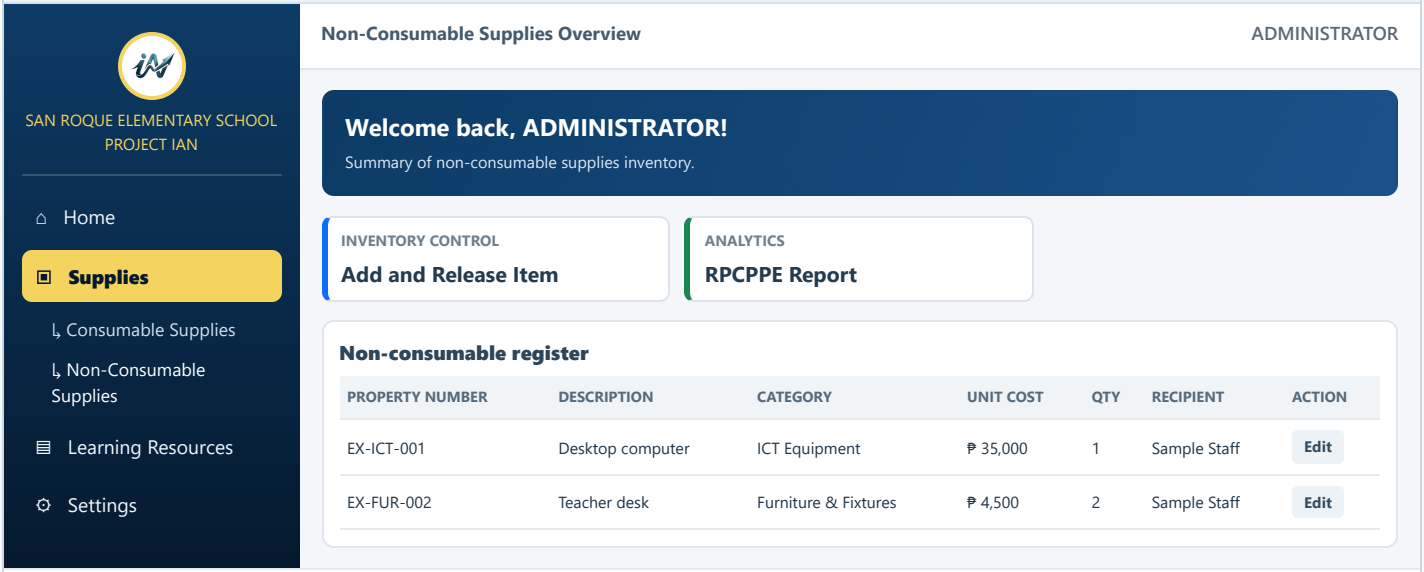

The cart is per signed-in administrator and may remain in that browser until cleared. Remove incorrect lines or clear the cart before completing a release.

05 · SUPPLIES

4 Non-consumable supplies

Open **Supplies** → **Non-Consumable Supplies** to record durable property and equipment. The list shows property number, description, category, costs, quantities, recipient, and remarks.

SCREEN PREVIEW · NON-CONSUMABLE REGISTER (SAMPLE DATA)

Interface preview only. Property details and amounts are fictitious examples; confirm official values from source records.

Add or release a property item

Select **Add and Release Item** and complete the property number, description, unit, category/item type, unit cost and total cost when available, quantity per Property Card, physical count, shortage/overage values, remarks, and recipient. Review the recipient and counts before selecting **Add Item**.

Use **Edit** to correct an existing row. Treat property-number and count changes as controlled records: verify against the physical item and official property documents before saving.

RPCPPE report

Select **RPCPPE Report** to open the property report. Check that the school profile, property records, classifications, and quantities are complete before printing. Use the browser's print dialog to choose printer or Save as PDF.

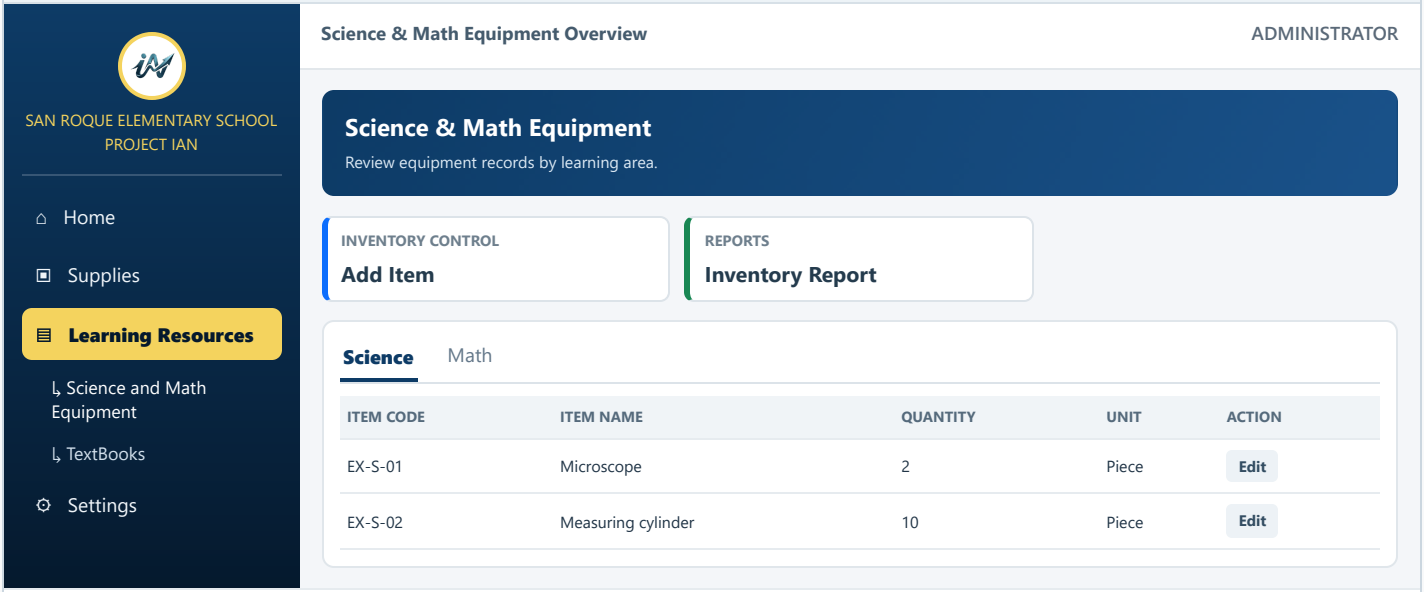

Good practice: Enter the correct unit of measure and category consistently. An incorrect category or physical count affects review and official reporting.

06 · LEARNING RESOURCES

5 Science, Math, and textbooks

Open **Learning Resources** in the sidebar and choose a page. Set up staff and units first so recipients and unit lists are available.

SCREEN PREVIEW · SCIENCE & MATH EQUIPMENT (SAMPLE DATA)

Interface preview only. All codes, equipment, and quantities are fictitious.

Science & Math equipment

Choose the **Science** or **Math** tab. Select **Add Item** and enter the item code, item name, quantity, unit, and type. Check the selected tab/type before saving. Use row actions to edit or delete; use **Inventory Report** for a printable report.

TextBooks

Open **TextBooks**, select **Add Textbooks**, then enter item name, grade level, subject, quantity, unit, teacher recipient, and condition (New, Used, Old, or Damage). Use the list to review records and the **Textbooks Report** card to print/export the report.

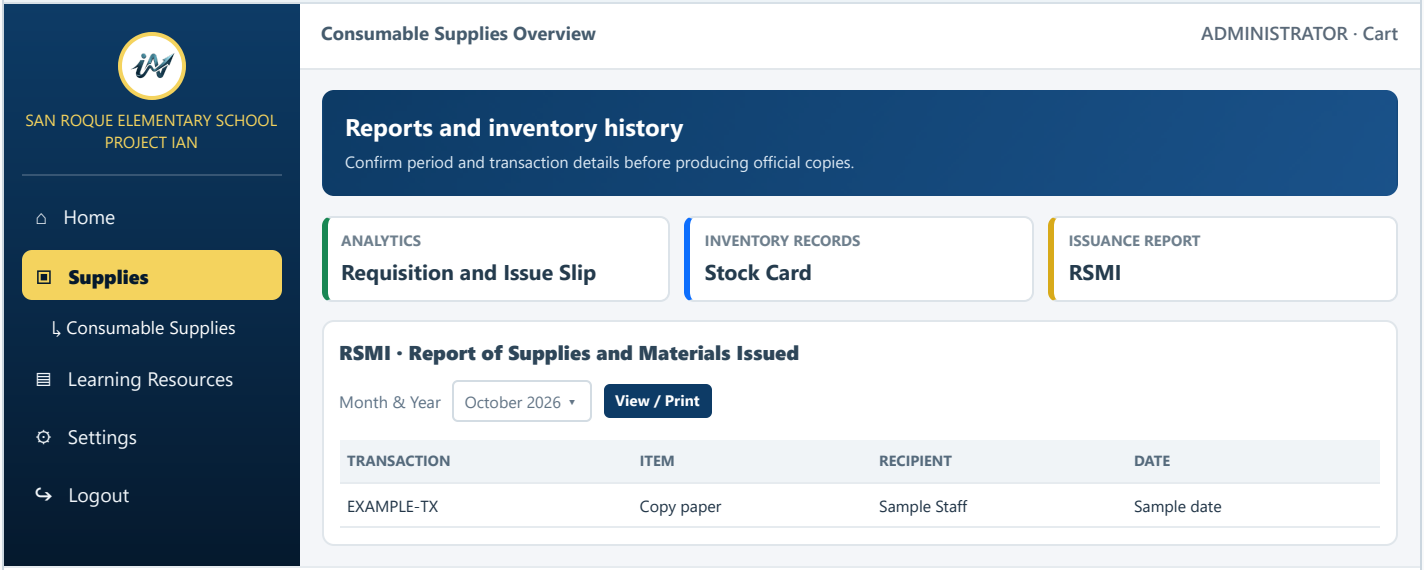

> Only select a teacher recipient after their employee record exists in Settings. Keep condition and quantity aligned with the physical books on hand.

07 · FINISH SAFELY

Reports, backups, and logout

Review records before printing, keep a protected backup, and close the local app when you finish.

SCREEN PREVIEW · CONSUMABLE REPORTING ACTIONS (SAMPLE LAYOUT)

Interface preview only. Names, transactions, and dates are fictional examples.

Print or save a report

- Consumables: **Requisition and Issue Slip** opens the transaction list; **Stock Card** shows item history; **RSMI** is filtered by month/year.
- Non-consumables: use **RPCPPE Report**. Learning Resources has separate Science/Math and Textbooks reports.
- Check the selected period, school details, item names, quantities, and recipients. Choose a printer or **Save as PDF** in the print dialog.

Back up and restore

- Recommended: use the Windows Start Menu **Back Up Inventory System** shortcut. Store the SQL file somewhere separate and protected.
- Restore with the Start Menu **Restore Inventory System** shortcut; select a trusted backup and confirm replacement.
- Settings → Database can also download a backup or import an SQL file. Import replaces current contents.

Log out and close

Select **Logout** in the sidebar and confirm. Close the Inventory System window to stop its local services. If the default browser was opened instead of the app window, use **Stop Inventory System** from the Start Menu.

Protect the data: SQL backups contain readable inventory and account data. Store them privately. Do not delete the app's database files manually or uninstall with the remove-data choice unless you intend to erase the records and backups.

If startup fails: retry once; check whether another local service is using resources. For the packaged installer, logs are under `%LOCALAPPDATA%\InventorySystem\logs`. Preserve the data folder and restore a known-good backup only after seeking administrator help.
